

1. Doing research: basically understand what language we will use, and how many file we need to write. Keywords, terms, etc.
2. Learning language: New language using, find the free website, practice before we code actually.
3. Read template, there are a lot free template online. Because we don't have experience before, so look other people doing is really helpful
4. Team rules: Don't know others before, need to have some rules make work efficiency.
 - we need a leader to manage the time, people keep forget the due time.
 - And we need start to share our schedule to each other, meet weekly hopefully each week, even with tiny improvement.
 - Making a formal planning.
 - Between the meeting, what things we need to finish by individually.
 - If someone didn't finish on time what could we do?
 - When we meet problem about the language, who could we ask?
 - Where do you want to write down the code?
